0 About this document

Glöder forecom proof [5, 1] is highly interesting, but may be hard to understand, Some of this difficulty is due to the fact that the entation used by Glöder has been happly replaced by other notation. Some of this difficulty is due to the fact than while Glöder is demonstrated as or sension, they connections require the readers to make up their own interpretations for formulae, or to keep definitions in mind that may not seem moments to those.

This document is a translation of a large part of Gidel's proof. The translation happens on three levels:

- from German to English
- from Glidel's notation to more common mathematical combols.
- · from paper to hyper-test

By previous and entire are used as follows definitions take place in the riskles, this defined forms. Wherever the defined term is used, we have a red hyper-link to the place in the text where the term was first defined, the this riskland term. Furthermore, each defined term appears in the risklands index at the end of this document. In the margin of the document, there are page-manders like this [10%, which rode to the original document, flows are placed in the college properties [10%, which rode to the original document, flows are links for bothing up something by page 123–171–171–176.

727–128–179 to [10] [10] [20] [31] [34] [35] [36] [37] [38, [36] [36] [36] [36], [36] [36], [3

This translation omits all fact-notes from the original, and only contains sections 1 and 2 (out of four).

The translation converses in it with no explicit or implied warranty. The at your own risk, the translator is not willing to take any negonability for problems you might have because of orners in the translation, or because of mismoderatandings. You are permitted to reproduce this document all you like, but only if you include this notion.
